

User manual for `kluwer.cls`, version 1998/02/11

Instructions for authors

Prepress Department (texhelp@wkap.nl)*

Wolters Kluwer Academic Publishers, Achterom 119, 3311 KB Dordrecht, The Netherlands

1998/02/11

Abstract. This is the user manual for the `kluwer.cls` class file for the preparation of articles to be submitted to journals, spin-offs of journals or edited volumes to be published by Kluwer Academic Publishers. The `kluwer.cls` is a generic class, which allows us to use a trivial conversion to different layouts. The `kluwer.cls` class file functions similar to the `article` class file of $\text{\LaTeX} 2_{\epsilon}$, but it has some extra fields in the preamble and some extended commands for the body text.

Keywords: $\text{\LaTeX} 2_{\epsilon}$, (electronic) submission, user manual, class file, Kluwer

Abbreviations: KAP – Kluwer Academic Publishers; compuscript – Electronically submitted article

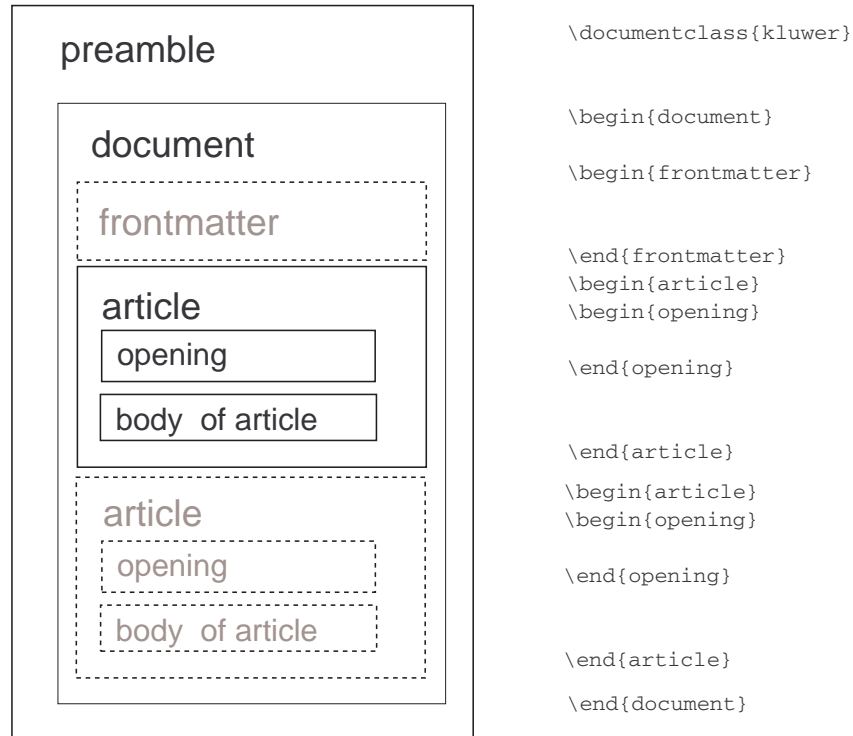

Figure 1. Overall structure for input files. Optional parts are displayed in grey (with dotted lines) on the left side.

1. Introduction

The `kluwer` class file is the general style file that should be used when submitting an article in $\text{\LaTeX} 2_{\epsilon}$ for publication in one of the journals of Wolters Kluwer Academic Publishers.

The layout generated by the `kluwer` class file will deviate from the style of the journal in which your article will be published. The article will be formatted in the appropriate journal style by Kluwer after acceptance. In that stage, the copyright information will be added, the running heads will be adapted if necessary and the article will be typeset in the Times Roman font.

2. Getting started

The overall structure of an input file is given in figure 1.

2.1. THE BEGINNINGS

The `kluwer` class file is addressed by using the command:

`\documentclass{kluwer}`. The file `kluwer.cls` and its subfiles should be accessible to $\LaTeX 2_{\epsilon}$.

The class file defines some options that can be inserted between angle brackets. These options will be introduced as we go along. (Quickstart: insert either `numreferences` or `namedreferences` to set the style for citations and bibliographic lists)

The date for this version of the class file is 1998/02/11.

Amongst other things, the class file has already loaded the packages `amssym` and `wasysym` on startup. Support for ‘Here’ style floats, rotated floats and endnotes is built in.

2.2. THE PREAMBLE

In general, you should use standard \LaTeX commands as much as possible. If you create your own macros *always* put them in the preamble, and use \LaTeX syntax instead of `\def` whenever possible. Take extra care to make sure that we receive and/or can obtain *all* included package files used by your submission.

As a rule of thumb, we can find only what’s in a relatively recent “standard \LaTeX distribution”; anything else should be sent to us, together with your submission.¹

3. The ‘opening’ environment

The title, subtitle, author names & affiliations and the submission dates for the article are handled by the `opening` environment.

In Figure 2 you will find a list of the chain of commands that should be used only within the `opening` environment. Most of these commands will produce an error if used somewhere else in your document. The subsequent paragraphs will deal with the commands in detail.

The order of commands you find in the figure is not fixed, all commands are executed by `\end{opening}`, without regard to their location within the `opening` environment (with an exception for the author block, please see below for details). Anything that is not within a command will end up being typeset *before* the ‘real’ contents of the environment, so be careful to only use the commands given here.

¹ This also includes outdated versions of currently available macro packages. For instance, if you use an old version of the `amstex` package, you should send those files as well, since we usually only have the latest versions of any package.

```

\begin{document}
\begin{article}
\begin{opening}
% Title block:
\title{...}
\subtitle{...}
% Author block [repeatable]:
\author{...\surname{...}\email{...}}
\author{...\surname{...}\email{...}}
\institute{...}
% Extra information:
\dedication{...}
\translation{...}
\runningtitle{...}
\runningauthor{...}
\begin{ao}
....
\end{ao}
\begin{motto}
....
\end{motto}
% Abstracts & keywords:
\begin{abstract}
...
\end{abstract}
\keywords{...}
\abbreviations{\abbrev{...}{...};
               \abbrev{...}{...}}
\nomenclature{\nomen{...}{...}; \nomen{...}{...}}
\classification{...}{...}
\end{opening}

```

Figure 2. Commands to be used within the opening environment

Now let us explain the commands in more detail.

3.1. TITLE AND SUBTITLE

The title and, if necessary, subtitle should be typed in one of the following two styles of capitalisation:

```
\title{This is my title}      One initial capital
\title{This Is My Title}     Initial capitals
```

This has to be done according to the style of the journal in which your article is to be published. Uppercasing will be done by the stylefile if necessary. A missing `\title` command generates an error message.

You can split the typeset title and subtitle over multiple lines by putting two backslashes at an appropriate place, and you can specify footnotes to the title by use of the `\thanks` command. The specified text will be placed at the bottom of the page as a footnote.

An example of a title block could look like this:

```
\title{The 'KLUWER' LaTeX Style File:\\
      Instructions for Authors\thanks{Donald Knuth}}
\subtitle{Basic Instructions}
```

3.2. AUTHOR BLOCK

The author block consists of one or more authors followed by an institute. This construction may be used more than one time. A typical ‘large’ author block would look like this:

```
\author{A. \surname{Thor1}\email{thor@wkap.nl}}
\author{B. \surname{Thor2}\thanks{Partially support...}}
\institute{KAP}
\author{C. \surname{Thor3}}
\institute{}
```

As you can see, the surname of the author is given within a separate command, `\surname`. The point of this is that this makes it easier to extract information from the \LaTeX file. It has no influence on the way the author’s name is typeset.

You can specify support acknowledgements etc. by use of the `\thanks` command.

If the author has an email address that looks like it will last for at least the time between submission and publication, you can give the address in the `\email` command either after the surname of the author or in the `\institute` command. It will be typeset in small typewriter font within brackets.

The specification for the author block is a bit more complicated than the rest of the opening environment. Please take note of the following restrictions:

1. Order is important for all `\author` & `\institute` commands. They will be typeset in the same ordering as found in your input file.
2. `\thanks` can only be used as the very last item in the `\author` command. If you make a mistake, you will get a quite incomprehensible \TeX error message.
3. The list of authors *has* to end with an institute. If there are authors that are not part of any institute, give an empty command as demonstrated above. If you don't, that author's name will *not* be typeset.
4. Sometimes the class file may fail to find a good place to break a line containing multiple authors. If this happens, you can insert two backslashes (`\`) yourself to force a line break after an author's name or email address (It will *not* work if the two backslashes are the first characters within `\author`. In this case there will be a \LaTeX error 'No line to end').

3.3. EXTRA INFORMATION

These commands give some extra information about the article.

3.3.1. *Dedicated and translated articles*

You can use the commands `\dedication` and `\translation` to give extra information about your article. The commands help by inserting the correct amount of space above and below your text.

3.3.2. *Running heads*

You can create a running title (used on odd pages) by using the `\runningtitle{}` command, where you put the (maybe shortened) title between the curly braces, and you can create a running author line (used on even pages) using the analogous `\runningauthor` command.

Both of these commands may be used in strange ways by \LaTeX , so try to keep the information short enough to fit in the headline, and try to use only plain text. For instance, don't try to force line breaks in the running title, and don't insert `\labels`

3.3.3. *Address for correspondence*

The environment `ao` can be used to give an address for correspondence or offprints. The contents of this environment will be typeset at the end of the article environment (an example is given in this document on page 26). The exact phrasing of the leading text depends on the stylefile, so it may change later here at Kluwer.

3.4. ABSTRACTS AND KEYWORDS

The abstract environment is used to give a short description of the article.

The `\keywords` command gives a list of keywords. These should be separated with commas.

The `\abbreviations` command allows to give a list of abbreviations used. It defines a sub-command `\abbrev` with two arguments, of which the first is the abbreviation and the second the meaning. The exact layout will once again depend on the used stylefile.

Here is the example from the beginning of this document:

```
\abbreviations{\abbrev{KAP}{Kluwer Academic Publishers};
\abbrev{compuscript}{Electronically submitted article}}
```

The command `\nomenclature` is closely related to `\abbreviations`. It takes one argument subdivided into `\nomen` parts. The above example gives the correct syntax. For both environments it is legal to have text outside of `\abbrev` respectively `\nomen`, in which case it will just be typeset as flushed text, and you have to provide additional formatting yourself. This is discouraged.

The command `\classification` takes two arguments, the first describing the type of the classification, the second the classification proper. An example might be:

```
\classification{JEL codes}{D24, L60, 047}
```

3.5. DATE

By using the `\date` command, it is possible to specify reception and acceptance dates. Since this is something that the journal's editor fills in, the default value when no `\date` command is given is to insert a template line that allows easy fill-in of this information. As a result, you are advised not to use this command.

3.6. MOTTO

When you want to specify a piece of poetry/a quotation to specify a motto to your article, you can use the `motto` environment. You can differentiate between prose and poetry. If you are using prose, give an extra option to the environment: `[prose]`

Here is an example:

```
\begin{motto}[prose]
The only thing that never looks right is a rule.
There is not in existence a page with a rule on it
```

that cannot be instantly and obviously improved by taking the rule out.

```
\rightline{George Bernard Shaw, In {\it The Dolphin} (1940)}
\end{motto}
```

Here ends the description of the opening environment.

4. Mathematical constructs

This section gives an overview of the mathematical constructs that are supported by the class file.

4.1. SYMBOLS

As already stated above, the class file includes both `amssymb` and `wasysym` on startup. That is, provided these can be found. There will be no error if they are not available.

All of the commands for symbols from these packages will of course be available. Additionally, there are some commands defined in the `klumac.sty`. A short overview is given in Table I.²

Please see the documentation for `amssymb` and `wasysym` for the additional symbols these packages provide (most of `amssymb` is also given in (Goossens *et al.*, 1994)).

4.2. VAREQUATION ENVIRONMENT

Since it can be quite hard to live with the automatic numbering of equations that \LaTeX implements, there is an extra environment defined to handle ‘special’ equation numbers.

The `varequation` environment allows you to give a ‘number’ to displayed equations, but without incrementing any \LaTeX counters. If you intend to use mathematical symbols inside the argument (as demonstrated below), be sure to use `\ensuremath`, or otherwise your input may fail under some internal stylefiles (i.e. those that use equation numbers on the left side of the page).

```
\begin{varequation}{\ensuremath{3\alpha}}
E = mc^2
\end{varequation}
```

² Some of these commands actually use the AMS fonts. This means that if you do not have these fonts, the commands will fail with a ‘missing font..’ error.

Table I. Additional math symbols made available through `kluwer.cls`

I	<code>\I</code>	a	<code>\down{a}</code>
Res $\overset{a}{\text{Res}}$	<code>\Res{a}</code>	$\uparrow\uparrow$	<code>\dres</code>
\bigcirc	<code>\bigO{a}</code>	\Vdash	<code>\forces</code>
\frown	<code>\concat</code>	\leq	<code>\grlo</code>
C	<code>\dC</code>	\gtrsim	<code>\gsim</code>
IE	<code>\dE</code>	I	<code>\iduaal</code>
IF	<code>\dF</code>	lh	<code>\lh</code>
IL	<code>\dL</code>	\geq	<code>\logr</code>
IN	<code>\dN</code>	\lesssim	<code>\lsim</code>
IP	<code>\dP</code>	\downarrow^a	<code>\mapdown{a}</code>
Q	<code>\dQ</code>	\xrightarrow{a}	<code>\mapright{a}</code>
IR	<code>\dR</code>	\neq	<code>\nequiv</code>
ZZ	<code>\dZ</code>	\otimes	<code>\oast</code>
depth	<code>\depth</code>	range	<code>\range</code>
\diamond	<code>\diamond</code>	\uparrow	<code>\res</code>
dom	<code>\dom</code>	\downarrow	<code>\restrict</code>

And the resulting formula:

$$E = mc^2 \tag{3\alpha}$$

4.3. SUBEQUATION ENVIRONMENT

A subequation environment is available to create equations with sub-numbering of the equation counter. It takes one (optional) argument, that specifies the way that the added counter should be typeset.

```
\begin{subequation}[options]
\begin{equation}
...
\end{equation}
\end{subequation}
```

Possible options are:

- alph (1a) This is the default.
- Alph (1A) Uppercase
- arabic (1.1) Arabic numbers.

4.4. DISPLAYED SENTENCES: THEOREMS AND SUCH

The `kluwer` class file contains a pre-defined lay-out for theorems, corollaries, etc. These environments have to be defined with the help of \LaTeX 's `\newtheorem` command. Here is an example:

```
\newtheorem{theoremdemo}{Theorem}
\begin{theoremdemo}
This is a \verb!\newtheorem!.
\end{theoremdemo}
```

Results in:

THEOREM 1. *This is a `\newtheorem`.*

The class file also defines a `\newdisplay` command, which is identical to `\newtheorem` in usage, but will give a different layout. Here is an example:

```
\newdisplay{displaydemo}{Theorem}
\begin{displaydemo}
This is a \verb!\newdisplay!.
\end{displaydemo}
```

Results in:

Theorem 1. This is a `\newdisplay`.

For more information on the use of the `\newtheorem` command, please refer to the \LaTeX manual.

Also, the class defines an extra command, `\newproof`, that can be used for displayed text of a lower level. The major differences are that this command does not define a counter to go with the environment, nor does it have an option to specify such a counter.

```
\newproof{rem}{Remark}
```

is almost identical to³

```
\newenvironment{rem}{\par\bigskip \bf Remark: \it}
{\par\bigskip}
```

³ There are some more commands involved of course, but this is a reasonable approximation.

4.5. PROOFS

For proofs, you can use the `pf` environment. This will generate the heading ‘*Proof.*’ If you wish to create your own heading, you can use `pf*` and give the `\begin{pf*}` command your alternative heading as an extra argument. Thus, `\begin{pf*}{Proof (of Lemma 3)}` will generate the heading ‘*Proof (of Lemma 3).*’

5. Sectioning commands

This section gives an example of the sectioning commands.

6. Section

Here is a section

6.1. SUBSECTION

Here is a subsection

6.1.1. *Subsubsection*

And a subsubsection

6.1.1.1. *Paragraph* This is a lead-in heading (paragraph)

Subparagraph This is a lead-in heading (subparagraph)

There is also a command `\part`, but it has not been particularly well designed.

The general syntax of these commands should be known to you already. We have made no changes apart from the layout.

7. Lists and displayed text

The document class redefines `itemize` and `enumerate` so that they take an optional argument that makes some parameterization possible.

Also, there are some environments available to do displayed text, for instance, quotations.

7.1. ITEMIZE

In the case of `itemize` the optional argument specifies the label that should be used as default.

```
\begin{itemize}[$\bullet$]
\item This is an example of a list with an optional argument
\item[--] This is the second item
\end{itemize}
```

```
\begin{itemize}
\item Ordinary.
\end{itemize}
```

Will result in:

- This is an example of a list with an optional argument
- This is the second item

7.2. ENUMERATE

In the case of `enumerate` the optional argument specifies the width of the left margin (in approximately the same way as for the `thebibliography` environment).

```
\begin{enumerate}[000000]
\item See the wide left margin below?\\ Next line
\end{enumerate}
\begin{enumerate}
\item Normal.\\ Next line
\end{enumerate}
```

Will result in:

1. See the wide left margin below?
Next line
1. Normal.
Next line

The default value for the optional argument is 00, which is approximately 1em.

7.3. USING POETRY, QUOTES, AND QUOTATIONS

To do ‘ordinary’ quotes and quotations, there are the environments `verse`, `quote` and `quotation`. Here are some small examples of each:⁴

Here’s a verse:

I think you will like them,
when you shall see them on a beautiful quarto page,
RICHARD BRINSLEY SHERIDAN, *The School for Scandal* (1777)

A quote:

When a proof has been sent me with two or three lines so widely spaced
as to make a grey band across the page, I have often rewritten the passage
so as to fill up the lines better

GEORGE BERNARD SHAW, in *The Dolphin* (1940)

A quotation:

There was things which he stretched, but mainly he told the truth.
MARK TWAIN, *Huckleberry Finn* (1884)

7.4. VITAE FOR AUTHORS

Because of the fact that a lot of our articles end with a short vita(e) of the author(s), we have provided a `vitae` environment. Usage is as follows:

```
\begin{vitae}
\Vauthor{Author1} ...
\Vauthor{Author2} ...
\end{vitae}
```

This environment is smart enough to notice the difference between one author and more than one author, which will be reflected in the generated heading.

Authors’ Vitae

Hoekwater, T

This author spends most of his working life answering questions about \TeX and \LaTeX .

Author 2

...

⁴ If you do not know how to use these environments, see the examples in this file.

7.5. SPECIAL SECTIONS FOR NOTES AND ACKNOWLEDGEMENTS

Just as most articles have a bibliography, a lot of articles also contain ‘Notes’ and ‘Acknowledgements’. For this reason, there are respectively the environments `notes` and `acknowledgements`.

Here are some examples again:

```
\begin{notes}
\item Please note that this class file is provided
      {\it as is}, and is \textcopyright\index{copyright}
      by Kluwer Academic Publishers. You are free to use
      this class file as you see fit, provided that you do
      not make changes to the included macro files.
      If you do make changes, you are required to rename
      the changed files.\index{making changes}
\end{notes}
```

Notes

1. Please note that this class file is provided *as is*, and is © by Kluwer Academic Publishers. You are free to use this class file as you see fit, provided that you do not make changes to the included macro files. If you do make changes, you are required to rename the changed files.

```
\begin{acknowledgements}
...
\end{acknowledgements}
```

Acknowledgements

I would like to thank Donald E. Knuth for the fact that he wrote this brilliant program, thereby indirectly supporting my wife, my cats and myself.

8. Footnotes and endnotes

When using the `kluwer` class file, you can produce endnotes analogous to \LaTeX footnotes. Instead of the `\footnote` command you use `\endnote`. The command `\theendnotes` should be used to place the endnotes in the text. They will be put in a separate ‘Notes’ section in the `\footnotesize` font.

For use in locations where `\writes` fail (tables etc.), there are the companion commands `\endnotemark` and `\endnotetext`.¹

9. Floats

The `kluwer` class file defines three major kinds of float, and some derivatives like `star-ed` environments and `sub...` versions.

9.1. TABLES

In general, here is how the `table` environment is intended to be used:

```
\begin{table}[placement options]
...
\caption[optional short version]{Caption text.}
\label{unique label}
\end{table}
```

For *placement options* you can use a variable subset of the following characters:

- t This indicates placement at the top of a page. This may be the current page, but it could also be one of the subsequent ones.
- b This indicates placement at the bottom of a page. This may be the current page, but it could also be one of the subsequent ones.
- p This indicates placement on a page that contains floats only, no text.
- h This should mean ‘here’, but it is not always possible (there may not be enough space left on the page). In that case, \LaTeX will change this to `[ht]`.

The following option is special:

- H Also means ‘here’, but in a more rigorous way. If there is not enough space left on the page, the page will be filled up with whitespace and the float will appear at the top of the next page. The difference between `h` and `H` is that `H` *never* skips over the following text.

The table caption is given with the `\caption` command. This command is required! If you do not have a caption, use `\caption{}`. As you will see in the examples below, the correct way to tag a table for referencing through `\ref` is by putting the `\label` *after* the caption command.

Table II. Caption text.

Description 1	Description 2	Description
Row 1, Col 1	Row 1, Col 2	Row 1, Col 3
Row 2, Col 1	Row 2, Col 2	Row 2, Col 3

9.1.1. Examples

Two examples of typical tables follow. Their output can be seen in Tables II and III.

We wish to avoid using both vertical rules between columns and horizontal rules between rows. You should, however, always use the following three horizontal rules: a top rule, a middle rule and a bottom rule.

As you can see, we have made some adjustments to the line spacing, effectively disabling vertical rules completely because they create gaps. We saved the old environment in `TABULAR` in case somebody absolutely needs it.

```

\begin{table}
\caption{Caption text.}\label{tab1}
\begin{tabular}{lll} \hline
Description 1 & Description 2 & Description \\ \hline
Row 1, Col 1 & Row 1, Col 2 & Row 1, Col 3 \\
Row 2, Col 1 & Row 2, Col 2 & Row 2, Col 3 \\
\hline
\end{tabular}
\end{table}

```

Note in the following example that we also adjusted `tabular*`, so that now the columns always fill the total width you specified. The special `\maxfloatwidth` dimension is the maximum allowed width of the float. This is important because some of our journals have indented floats, so the float is not allowed to be as wide as `\textwidth`, while rotated tables (see below) have an allowed width of (almost) `\textheight`.

Table III. Caption text.

Description 1	Description 2	Description
Row 1, Col 1	Row 1, Col 2	Row 1, Col 3
Row 2, Col 1	Row 2, Col 2	Row 2, Col 3

```

\begin{table}
\caption{Caption text.}\label{tab2}
\begin{tabular*}{\maxfloatwidth}{l l l} \hline
Description 1 & Description 2 & Description \\ \hline
Row 1, Col 1 & Row 1, Col 2 & Row 1, Col 3 \\
Row 2, Col 1 & Row 2, Col 2 & Row 2, Col 3 \\
\hline
\end{tabular*}
\end{table}

```

9.2. ADDITIONAL COMMANDS FOR ‘TABULAR’ AND ‘TABULAR*’

As you saw above, there are some changes to the `tabular` and `tabular*` environments. Apart from the extended baseline and the filling out of `tabular*`, there are also four extra commands to draw partial horizontal lines, these are:

`\rcline`; which leaves some space to the *left* of the line
`\lcline`; which leaves space to the *right* of the line
`\rlcline` and `\lrcline`; these two leave space on both sides.⁵

These commands are used in the `tabular` below:

Description 1	Description 2	Description
A	Row 1, Col 2	Row 1, Col 3
B	Row 2, Col 2	Row 2, Col 3

```

\begin{tabular}{l l l} \hline
Description 1 & Description 2 & Description \\
\lcline{1-1}\rlcline{2-2}\rcline{3-3}
A& Row 1, Col 2 & Row 1, Col 3 \\
B& Row 2, Col 2 & Row 2, Col 3 \\ \hline
\end{tabular}

```

⁵ Both mean the same thing, but the double definition maintains symmetry.

Figure 3. This is the caption of the figure. This is the tiger from the GhostScript distribution.

9.3. FIGURES

For figures, there are the environments `figure` and `figure*`. Both of these support the same optional placement specifiers as `table`; if you want to look into them again, see 15 in section 9.1

A typical figure will look like the following example:

```
\begin{figure}
\centerline{\epsfig{file=tiger.eps,width=16pc}}
\caption{This is the caption of the figure.}
\end{figure}
```

Note that this example needs the line

```
\usepackage{epsfig}
```

in the preamble of your document. Please see the documentation for `epsfig` (or (Goossens *et al.*, 1994)) about the options you can specify in the `\epsfig` command.

9.4. FURTHER OPTIONS FOR TABLES AND FIGURES

`figure` and `table` also allow you to use the environments `subtable` and `subfigure`. These two environments are analogous to `subequation`, that was explained previously in section 4.3.

To rotate a table or figure over 90 degrees counterclockwise, enclose the entire table/figure in the `kaprotate` environment.

```

\begin{kaprotate}
\begin{table}
...
\end{table}
\end{kaprotate}

```

If you rotate a float, it will always use an entire page.

In two-column styles, there is a difference between the starred forms `figure*` and `table*` compared to their normal forms. The starred forms of `table` and `figure` will be `doublecolumn`, while the ordinary forms are one column. This distinction also holds for rotated versions.

10. References

References are inserted in the `thebibliography` environment. We distinguish two styles of References lists: alphabetically sorted (explained below in section 10.1) and numbered (explained in section 10.2). You can select one of these styles by including the appropriate document option in the `\documentclass` command. *Please refer to the style of the journal concerned when choosing an option for your references.* If no document option is included, the class file will usually presume named references.

10.1. ALPHABETICALLY SORTED REFERENCES

For alphabetically sorted references one should include the document option `namedreferences` in the preamble command:

```
\documentclass[namedreferences]{kluwer}
```

Every `\bibitem` in the `thebibliography` environment should have a `\citeauthoryear` command as an option and a key to be referred to. The `\citeauthoryear` should have two arguments: the author's name(s) and the year. The `\citeauthoryear` should be preceded by a `\protect` and in the case of more than two authors the argument with the author's name(s) should contain the first author's name with an *et al.*, e.g.:

```
\bibitem[\protect\citeauthoryear{authorname(s)}{year}]{key}
```

The first part of your References section could look like this:

```
\begin{thebibliography}{} % Note the empty pair of curly braces!

\bibitem[\protect\citeauthoryear{Smith et al.}{1992}]{Smith92}
Smith, I.N., Johnes, R.S. and Hines, W.P.: 1992,
'Title of the Article',
{\it Journal\} {\bf Vol.-no.-X},
pp.~00--00
```

The following `\cite` commands can now be used in your article: `\cite`, `\shortcite`, `\citeauthor`, `\citeyear`, `\inlincite` and `\opencite`. For the sample `\bibitem` above, the four cite commands would generate the following reference in your text:

Call:	Produces:
<code>\cite{Smith92}</code>	(Smith et al., 1992)
<code>\citeauthor{Smith92}</code>	Smith et al.
<code>\citeyear{Smith92}</code>	1992
<code>\shortcite{Smith92}</code>	(1992)
<code>\inlincite{Smith92}</code>	Smith et al. (1992)
<code>\opencite{Smith92}</code>	Smith et al., 1992

With these commands or combinations of them you can create any reference in your text according to the reference style of the journal in which your article is to be published.

If you don't want to make use of references, but just want to generate a bibliographic list at the end of your article, you can use empty square brackets and braces, like this: `\bibitem[]{}.`

You must do the formatting of the bibitems yourself. For the layout conventions we refer you to the authors instructions of the journal in which your article is to be published.

10.2. NUMBERED REFERENCES

For numbered references one should include the `documentclass` option `numreferences` in the preamble command:

```
\documentclass[numreferences]{kluwer}
```

You should start the `thebibliography` environment with the command:

```
\begin{thebibliography}{99}
```

The second pair of curly braces should contain a number that corresponds with the widest number in the reference list below (usually 99 is the correct value).

You should label every `\bibitem` by putting a key between the curly braces, e.g.: `\bibitem{Smith92}` In your article you can refer to this `\bibitem` with `\cite{Smith92}`.

10.2.1. *Using the optional argument of `\bibitem`*

Do not use the optional argument to `\bibitem` in this case, since it will produce unexpected results.

The `\cite` command will produce the number of the reference in brackets, e.g. [2]. The `\shortcite`, `\citeauthor ...` commands, as mentioned in Section 10.1, can also be used but they will produce the same output as `\cite`.

You must do the formatting of the bibitems yourself. For the layout conventions we refer you to the authors' instructions of the journal in which your article is to be published.

10.3. `BIBTEX`

You can of course use `BIBTEX`, but if you do so, please make sure you send all the necessary files with the `LATEX` source file, i.e. the `bbl` file. You could also include the `BIBTEX` output directly in your article. Please don't send us `.bib` files.

Kluwer has `BIBTEX` style files available for the `namedreferences` and `numreferences` options. For named references, the file is called `klunamed.bst` and for `numreferences`, it is called `klunum.bst`. Both files are included with the distribution of the class file.

We refer you to the `LATEX` and `BIBTEX` manuals for further information on using `BIBTEX`.

11. Special options and extra information

11.1. MY PAGES COME OUT RAGGEDBOTTOM!

The sectioning commands always try to keep a certain amount of lines with them on the same page. Values may differ, but the typical values are: 3 lines for section and subsection, 2 lines for subsubsection.

If you find that your pages come out unbalanced, this could be the problem. The other likely problem is that you used a Here float on the page, and it didn't fit.

Figure 4. A) This is a figure. B) Second subfigure

11.2. AUTHORS' INSTRUCTIONS

The authors' instructions for certain journals are not up-to-date. Quite often the instructions indicate that submissions should be made with double line spacing, or that the journal does not accept electronic figures. Both of these statements do not apply to \LaTeX submissions. You do not have to change the baselines and we are always quite happy with Encapsulated Postscript figures.

11.3. SIDE BY SIDE FIGURES

The use of minipages to put two partial floats next to each other, as demonstrated in Goossens *et al.*, 1994, doesn't work with our class files. This is partially because of the way we have implemented floats, and partially a design decision. If you need two figures next to each other, do something like this:

```
\begin{figure}
\centerline{
\epsfig{file=tiger.eps,width=5pc}~A.\quad
\epsfig{file=tiger.eps,width=5pc}~B.
}
\caption{A) This is a figure. B) Second subfigure}
\end{figure}
```

11.4. DOUBLE ABSTRACTS

Sorry, but you cannot have multiple abstracts in one article. If you need one, you have to make a separation in *one* abstract environment.

11.5. LETTERSPACED TEXT, PROBLEMS WITH SECTIONS AND CAPTIONS

Certain journals require certain headings in a letterspaced font. While the stylefile provides for this, it interferes with writing to auxiliary files like the Table of Contents files. If you encounter incomprehensible error messages, the first thing you should try is to replace the offending `\caption{}`

or `\section{}` command by `\caption[{}]` or `\section[{}]`. You will sometimes also have to delete the `\jobname.aux` file.

If you tried this, and it didn't work, you can ask support from `texhelp@wkap.nl`. Please provide us with a log file that contains the error you received.

11.6. OPTAINING EXTRA FONTS / MACRO PACKAGES

You may want to get extra packages and/or fonts (like the `wasy` symbol font) if those are not provided at your site.

All \TeX related files on the internet are available for a large central archive called CTAN. Below you will find a list of the main sites and mirrors for CTAN. If you decide to download, please select a site near you (network-wise).

CTAN main archives

```
ftp.dante.de (Deutschland) /tex-archive
ftp.shsu.edu (Texas, USA) /tex-archive
ftp.tex.ac.uk (England) /tex-archive
```

CTAN mirrors

```
dongpo.math.ncu.edu.tw (Taiwan) /tex-archive
ftp.center.osaka-u.ac.jp (Japan) /CTAN
ftp.ccu.edu.tw (Taiwan) /pub/tex
ftp.cs.rmit.edu.au (Australia) /tex-archive
ftp.loria.fr (France) /pub/unix/tex/ctan
ftp.muni.cz (The Czech Republic) /pub/tex/CTAN
ftp.riken.go.jp (Japan) /pub/tex-archive
ftp.uni-stuttgart.de (Deutschland) /tex-archive (/pub/tex)
kadri.ut.ee (Estonia) /pub/tex
src.doc.ic.ac.uk (England) /packages/tex/uk-tex
sunsite.unc.edu (North Carolina, USA) /pub/packages/TeX
wuarhive.wustl.edu (Missouri, USA) /packages/TeX
```

If you do not have internet access, some of the packages from these sites can also be obtained by request from KAP, using the address at the end of this document.

11.7. SUBMITTING BUG REPORTS AND REQUESTS

If you have questions regarding our class file, or if you have discovered a bug, or if you have a request for something you would like to see included in the next version of this class file, send you comments to: `texhelp@wkap.nl` (e-mail) or to KAP PrePress, Achterom 119, 3311 KB Dordrecht, The Netherlands (regular mail).
